Pergunta 1

Correta

Nota: 1,00 em 1,00

Consider the following Screen Action flow, which includes custom validations on data submitted from the ContactForm. What should be the condition for the highlighted IF statement?

MainFlow ▶ BookDetail ▶ **SaveDetail**

Selecione uma opção:

- ☐ a. EmailAddressValidate(ContactForm.Record.Contact.Email) = True
- ☒ b. ContactForm.Valid = False ✓ It's correct!
- ☐ c. ContactForm.Valid = True
- ☐ d. EmailAddressValidate(ContactForm.Record.Contact.Email) = False or ContactForm.Valid = False

Before we send the record to the Database we want to validate if the form is or not valid. If the form's valid property isn't valid, the execution of the flow should be ended. However the form validation can be done in the negative (Form.Valid = False) using that condition the IF branches need to be set TRUE to **form not valid**, and FALSE to form valid to order the execution of the correct path.

Resposta correta: ContactForm.Valid = False

Pergunta 2

Correta

Nota: 1,00 em 1,00

Consider the two entities depicted in the image below, Desk and Room, that represent desks and rooms in a school. If you wanted to model that a Desk is placed inside a specific Room, what would be the best solution:

Selecione uma opção:

- ☐ a. Add a new attribute DeskIds, of type List of Desk Identifier, to Room.
- ☒ b. Add a new attribute RoomId, of type Room Identifier, to Desk. ✔ It's correct!
- ☐ c. Add a new attribute DeskId, of type Desk Identifier, to Room.
- ☐ d. Create a new entity RoomDesks, with two attributes DesksId and RoomId, respectively of type Desk Identifier and Room Identifier.

When there is a one-to-many relationship between two entities, meaning one row in entity A can have many matchings in entity B, we need to add a Foreign Key in entity B, so that when you look at a row in entity B, you now to which row it is connected in entity A. This is done by adding an attribute to entity B with the data type set to A Identifier.

Resposta correta: Add a new attribute RoomId, of type Room Identifier, to Desk.

Pergunta 3

Correta

Nota: 1,00 em 1,00

Assume that we have an Order Entity with at least the following attributes: OrderId, Year of the order, Amount, and Tax. How to set up the aggregate if I want to have the total amount of the Orders for each year, taking into account the tax?

Selecione uma opção:

- ☐ a. Do a GroupBy on the Year and do a Sum on the Amount. Create a computed attribute that multiplies the Sum of the Amount by the tax. Order by the Computed Attribute.
- ☐ b. Create a computed attribute that multiplies the Amount by the tax. Do a Sum on the Computed Attribute. Do a GroupBy on the Year. Order by the Computed Attribute.
- ☐ c. GroupBy the Year, the Amount, and the Tax. Create a computed attribute that multiplies the grouped Amount, by the grouped Tax. Order by the Computed attribute.
- ☒ d. Do a GroupBy on the Year. Create a computed attribute that multiplies the Amount by the tax. Do a Sum on the Computed Attribute. Order by the Sum of the Computed Attribute. ✔ It's correct!

The correct sequence of setting up an aggregate it's important. In case that you sum (aggregate function) all records of an aggregate, before you group the information by a specific criterion, the aggregate will return to you only one row with the result of your aggregate function, instead of one row for each line of your criterion. E.g. this is the difference between you count all users that you have your database, as a result, you will have only 1 row with the total, that now you can not split in genders, because you grouped all data no matter the gender. But if you first group the information by genders and then count the number of users that correspond for each gender, you will have a row for each gender with the total of users inside of it. (check the 4.3 - Advanced Aggregates to more details).

Resposta correta: Do a GroupBy on the Year. Create a computed attribute that multiplies the Amount by the tax. Do a Sum on the Computed Attribute. Order by the Sum of the Computed Attribute.

Pergunta 4

When you are debugging your Reactive application, you can place breakpoints on...

Selecione uma opção:

- ☐ a. Screens elements, like widgets and Screens Actions.
- ☐ b. Data Actions and Aggregates.
- ☐ c. Only in Screen Actions and Client Actions.
- ☒ d. Server and Client Actions. ✔ It's correct!

On document 5.3 - Debugging Apps, you can read what are breakpoints and where to add then.

Resposta correta: Server and Client Actions.

Pergunta 5

Correta

Nota: 1,00 em 1,00

Regarding Client Variables, what Data Types are available for them?

Selecione uma opção:

- ☐ a. All Data Types.
- ☐ b. Only Basic Data Types.
- ☒ c. Entity Identifiers and Basic Data Types except for Binary Data. ✓ It's correct!
- ☐ d. All, but should avoid complex Data Types.

By the rules described on 8.1 - Client variables, they are: "Restricted to Basic Data Types and Entity Identifiers"

Comments:

1.About

https://success.outsystems.com/Documentation/11/Reference/OutSystems_Language/Data/Handling_Data/Client_Variable

Resposta correta: Entity Identifiers and Basic Data Types except for Binary Data.

Pergunta 6

Correta

Nota: 1,00 em 1,00

Regarding updating a record of a Database Entity, it is correct to say:

Selecione uma opção:

- ☐ a. When done from a Client Action, connects the Device directly to the Database Server.
- ☒ b. It generates a Web Service Call to the Server, if done inside a Client Action flow. ✓ It's correct!
- ☐ c. Can be done from a Client Action, but not from a Screen Client Action.
- ☐ d. Can only be done from a Server Action.

When you call the Server to execute a Server Action, it is done using a Web Service in any Client Action.

Resposta correta: It generates a Web Service Call to the Server, if done inside a Client Action flow.

Pergunta 7

Incorreta

Nota: 0,00 em 1,00

A Block can have...

Selecione uma opção:

- ☐ a. any life cycle Event Handler (like OnInitialize and OnRender), but no Screen Actions, as its buttons and links are bound to its Parent Screen's Actions.
- ☐ b. any life cycle Event Handlers (like OnInitialize and OnReady) and Screen Actions.
- ☐ c. any life cycle Event Handler and Screen Actions but it can also use its Parent Screen's Actions.
- ☒ d. only Screen Actions, as any initialization it requires must be done on its Parent Screen's Events (like OnInitialize).

✗ The answer is not correct.

Check '9.1 - Screen events' document. There you can see that it's possible to set actions on events in the blocks and all life cycle events are available. Also, there is no restriction to bound screen actions to the widgets inside the block (like buttons), but those screen actions must be defined inside the block, as it has its scope (no direct access to anything outside itself).

Resposta correta: any life cycle Event Handlers (like OnInitialize and OnReady) and Screen Actions.

Pergunta 8

Correta

Nota: 1,00 em 1,00

Based on the image below, what should be the Value associated with the Expression Widget if you want to display the Movie Title?

Your data is fetched from the Data Action GetMovies, which returns the output Movies (Movie Record List).

Movie List

Add Movie +

Title	Year	Plot Summary	Gross Takings Amount
Expression	2015	Three decades after the defeat of the Galactic Empire, a new threat arises. The First Order attempts to rule the galaxy and only a ragtag group of heroes can stop them, along with the help of the Resistance.	\$815,843,529.00
Expression	2015	Three decades after the defeat of the Galactic Empire, a new threat arises. The First Order attempts to rule the galaxy and only a ragtag group of	\$815,843,529.00

x.y Expression ?

Properties

Name

Value

Example

Style Classes

Attributes

Property

= Value

Events

Event

Handler

MainFlow > Movies > GetMovies

Start

GetMovies

Movies

=

End

Selecione uma opção:

- ☐ a. Movie.Title
- ☐ b. GetMovies.Title
- ☒ c. GetMovies.Movies.Current.Movie.Title ✓ It's correct!
- ☐ d. GetMovies.List.Current.Movie.Title

Remember, even if your Table or List has its source bound to the Data Action, the widgets inside it can fetch and save data from/to a different location, like a local variable. So for each one of the widgets that you want to display a value fetched from the Data Action, you need to define the full path: `DataActionName.OutputListName.Current.EntityName.AttributeName`.

Notice that if you are using an aggregate, the start of your path will be `AggregateName.List...`, but if you are using a Data Action, the "List" changes the static name to the name of your Data Action Output. So it will be a dynamic name, like `GetMovies.Movies...`

Resposta correta: `GetMovies.Movies.Current.Movie.Title`

Pergunta 9

Correta

Nota: 1,00 em 1,00

The Form's Valid property...

Selecione uma opção:

- ☒ a. is automatically set to **False** when a field within the Form fails its validation. ✓ It's correct!
- ☐ b. **cannot** be checked before all custom validations are performed.
- ☐ c. is automatically set only if the user leaves all its fields blank.
- ☐ d. must be set explicitly using an Assign node in a Client Action.

The **Form's Valid** property it's Read Only. It is automatically set to FALSE whenever at least one field in the form fails any validation (automatic or custom). As a note, this property is available to be checked at any time, but usually, we use it to check if any validation failed, before performing the action (e.g. save a record), so there is no point (probably) in checking it before the custom validations are performed.

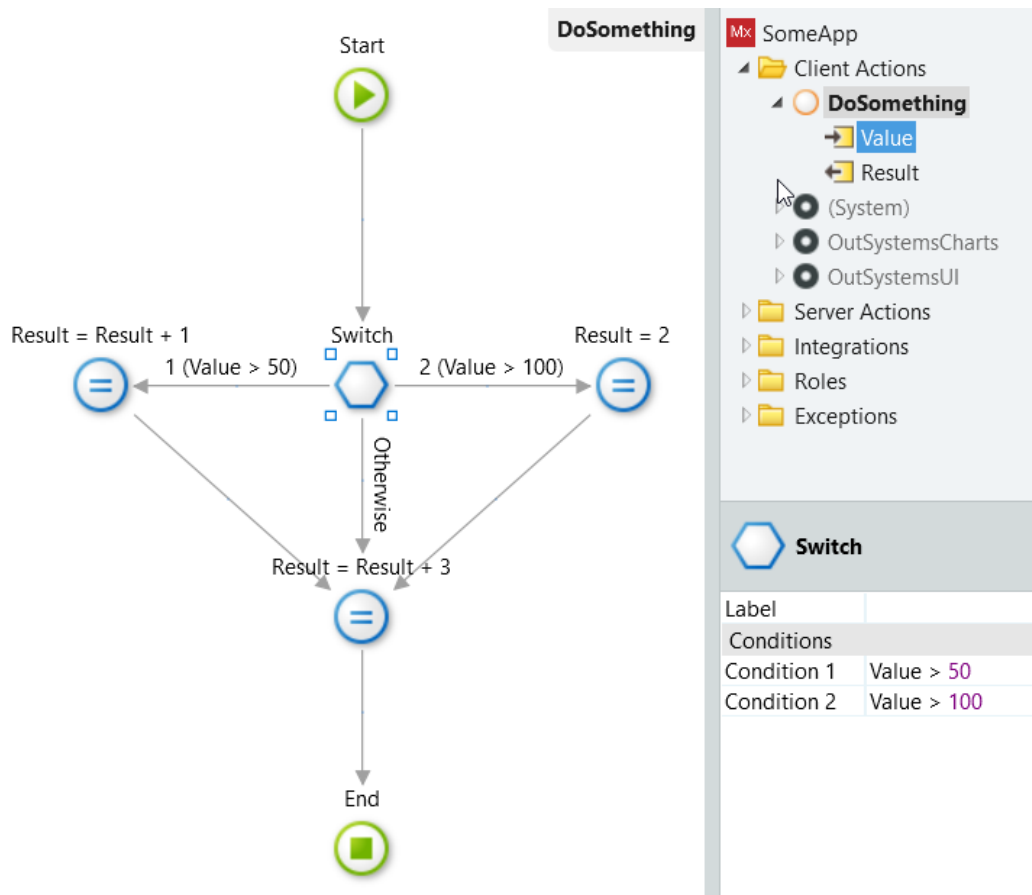

Resposta correta: is automatically set to **False** when a field within the Form fails its validation.

Pergunta 10

Incorreta

Nota: 0,00 em 1,00

Based on the image below, if Value is 150 and Result is initialized with 0, what will be the Result?

Selecione uma opção:

- ☐ a. The Result will be 2.
- ☐ b. The Result will be 4.
- ☐ c. The Result will be 3.
- ☒ d. The Result will be 1. ✖ The answer is not correct.

We use a Switch when you want to test multiple conditions in a specific order, following only the branch for the first condition that is true. If there is no condition returned as True, the mandatory "Otherwise" branch will be executed.

Resposta correta: The Result will be 4.

Pergunta 11

Incorreta

Nota: 0,00 em 1,00

What logic do you need to implement to only display the Delete button on the browser if a user has the role Admin?

Selecione uma opção:

- ☐ a. Add a Data Action to the screen to check the role, and use the output result as the condition value of the IF Widget.
- ☒ b. Use the CheckRoleAdmin() inside the condition value of the IF. ❌ The answer is not correct.
- ☐ c. Create a Client Function that checks if the current user has the Admin role. Then call the Client Function on the condition property of the IF Widget.
- ☐ d. Use an Aggregate to check if the current user has the role, and use its result on the IF conditional.

The CheckRole action returns true when the given user has a specific role. However, it is available in Server-side logic but not in Client-side logic. Therefore, to display a dynamic widget by checking if a user has a role, you need to use a Data Action as a bridge between Server Logic and Client-Side.

comment: https://success.outsystems.com/Documentation/11/Reference/OutSystems_Language/Logic/Built-in_Functions/Roles

Resposta correta: Add a Data Action to the screen to check the role, and use the output result as the condition value of the IF Widget.

Pergunta 12

Correta

Nota: 1,00 em 1,00

Consider the following Aggregate definition. If there are no Tracks on an Album, what will the output be?

The screenshot shows an Aggregate definition interface. On the left, under 'SOURCES', there are three entities: Album, Song, and Track. On the right, under 'JOINS', there are two joins defined: 1. Album (Album.Id = Track.AlbumId) and 2. Track (Track.SongId = Song.Id). Below the joins, there is a table representing the output. The table has columns: Group of Album (Album), Group of Artist (Artist), Count of Id (NumberOfTracks), Album (Name), Album (AlbumArtist), Album (Genre), Song (Name), and Song (SongArtist). The 'Count of Id' column is highlighted in blue, indicating it is the selected aggregate function. A '+ Add Source' button is at the bottom left, and a '+ Add Join' button is at the bottom right.

Selecione uma opção:

- ☒ a. An empty record list with the first 3 attributes only. ✔ It's correct!
- ☐ b. A record list with a single item composed by the visible grey-colored attributes. The Song's Name and SongArtist will be empty, though.
- ☐ c. A record list with a single item composed with the first 3 attributes. NumberOfTracks will be 0.
- ☐ d. A record list with a single item composed by all the source entities: Album, Song, and Track. Album information will be returned, Song and Track will be empty.

Aggregates follow the same rules as SQL, as it is a way to configure a database SELECT query. In a SELECT statement, the attributes available in the result, the ones you can add to the SELECT clause, depends if you are using the GROUP BY or Aggregate functions (count, max, etc.), or not. In Aggregates, the same will happen. But there is a visual hint about which attributes are available in the output: Only the blue attributes are available at the output of an Aggregate. Also, the order of the JOIN clause can discard the records that are being fetched in the case one of the JOINS fails.

Resposta correta: An empty record list with the first 3 attributes only.

Pergunta 13

Correta

Nota: 1,00 em 1,00

Fetching data from the database to show on a screen list...

Selecione uma opção:

- ☐ a. If done in a Client Action, is synchronous.
- ☒ b. If done with an Aggregate on the screen, is asynchronous. ✔ It's correct!
- ☐ c. Is always asynchronous, and must be done with a Data Action.
- ☐ d. Is always synchronous, and must be done in an Aggregate inside a Data Action.

Screen Aggregates and Data Actions have different ways to fetch data at the level of the screen and are executed asynchronously, multiple aggregates and data actions on the same screen will be executed in parallel, while screen DOM is built. Check the presentation "9.2 - Fetching data on-demand" from the slide deck.

Resposta correta: If done with an Aggregate on the screen, is asynchronous.

Pergunta 14

Incorreta

Nota: 0,00 em 1,00

Assume that the album artist "The Artist", typed in the form below, is **unknown** and we have the debugger running with a breakpoint set on the CreateOrUpdateAlbum action. What happens when a user clicks on the Save button which is configured with Built-in Validations?

Selecione uma opção:

- ☐ a. The debugger will pause execution at the breakpoint.
- ☒ b. The form will show validation messages for Name and Year. ❌ The answer is not correct.
- ☐ c. The form will show validation messages for Name, Album Artist and Year.
- ☐ d. An exception will be thrown because Year is not a number.

The built-in validations will set the input's Valid property to false if the user input has the wrong data type or if the input widget is mandatory and is left empty by the user. Also, in case that a custom validation in the action flow validates if one input value doesn't respect the business rules the form validation will mark this input widget as invalid, as well. So, as resume first, the built-in validations will be performed, and then the custom validations will mark the input that doesn't respect the business rules. And, when there is at least one input invalid, the Form's Valid property will be set to False, and the action execution will stop, and all messages for all invalid inputs will be shown on the form.

Resposta correta: The form will show validation messages for Name, Album Artist and Year.

Pergunta 15

Correta

Nota: 1,00 em 1,00

After you create an action in one module to be consumed by other modules, what's required to guarantee that you will not have any issues finding the action when managing the dependencies in the consumer modules?

Selecione uma opção:

- ☐ a. Publish the Producer module with the new Action before opening the Management Dependencies on the Consumer module.
- ☐ b. The new Action must be set as Public on the Producer module before consuming it in other modules.
- ☐ c. If the output of the Action is a Structure that is defined within the same module that the Action, that Structure needs to be Public as well.
- ☒ d. All the options are valid. ✓ It's correct!

To expose an element to other modules, do the following:

1. Set the element's Public property to 'Yes':
2. Publish your module. After publishing your module, the public elements can be reused by other modules in the environment through the Management Dependencies functionality.

If the element Public is an Action, whose Output is based on a Structure, the Structure needs to be defined as Public. If not, you will have an error on the Producer module that disables the Publish possibility, so the Consumer module will not see this new Action on Management Dependencies.

comment: OS Documentation at

https://success.outsystems.com/Documentation/11/Developing_an_Application/Reuse_and_Refactor/Expose_and_Reuse_Functionality_Between_Module

Resposta correta: All the options are valid.

Pergunta 16

Correta

Nota: 1,00 em 1,00

In a screen, you need to show some information that is stored in an Entity. But you only want to show it when the user requests it explicitly by clicking a link on the screen. In this scenario, choose the right option.

Selecione uma opção:

- ☐ a. Aggregates and Data Actions run asynchronously immediately after the Screen initialization happens, so use a Local Variable to store the information and use a Server Action to fetch the data when the user requests it.
- ☐ b. Use the System.IsPageLoad() action on the Aggregate's On After Fetch event to identify if the page is loading and remove the data in case it returns True. Later, use a Server Action with a Data Refresh to fetch the data when the user requests it.
- ☒ c. Set the Fetch property of the Aggregate to 'Only on demand' to avoid executing the Aggregate after the page is initialized and use a Data Refresh node to execute the Aggregate when the information is required. ✓ It's correct!
- ☐ d. For this scenario, it is not possible to use an Aggregate. Use a Data Action with an Input Parameter of type Boolean, that will be used to identify when to return the data. Call the action passing true to it when the user requests the data.

Aggregates have the **Fetch property**, where you can choose between **At Start** or **Only On Demand**. The first is the default option and is used when you need the data right away when the page is requested. If you don't need the data right away and want to implement logic to fetch the data when it is required after the page is requested, you can set the aggregate's Fetch property to Only On Demand. In this case, you need to refresh the aggregate in the logic to execute it.

Resposta correta: Set the Fetch property of the Aggregate to 'Only on demand' to avoid executing the Aggregate after the page is initialized and use a Data Refresh node to execute the Aggregate when the information is required.

Pergunta 17

Correta

Nota: 1,00 em 1,00

Regarding Blocks, select the correct answer.

Selecione uma opção:

- ☒ a. Blocks can be instantiated inside other blocks from a different module. ✓ It's correct!
- ☐ b. Blocks can read and assign variables from the screens where they are instantiated.
- ☐ c. All answers are correct.
- ☐ d. When a Block's local variable changes its value, the entire Block is always refreshed.

Blocks have their own scope, meaning that a block can't access data from its parent. Also, changing an input parameter value does not automatically refresh the entire block. Still, it triggers the On Parameters Changed block event that you can use to update the block's UI. (check the 7.1 - Blocks document for more details).

Resposta correta: Blocks can be instantiated inside other blocks from a different module.

Pergunta 18

Correta

Nota: 1,00 em 1,00

Related with Automatic Exceptions, select the **correct** option:

Selecione uma opção:

- ☐ a. All exceptions need to be defined manually inside the Actions flow.
- ☐ b. All exceptions are automatically thrown by the platform.
- ☐ c. Not Is Manager, Is Manager and other User Exceptions are automatic exceptions.
- ☒ d. Database, Communication and Security Exceptions are automatically thrown by the platform. ✓ It's correct!

The exceptions raised in your module are handled in a flow starting with an Exception Handler element. In an action, you can have more than one Exception Handler flow, in order to handle different types of exceptions.

An Action flow can have several exception handler flows

- Database Exceptions
- Security Exceptions
- Communication Exceptions
- Custom User Exceptions

The Database, Security, and Communication Exceptions are raised and handled automatically by platform. The logic to handle the User Exceptions needs to be manually defined by the developer.

comment:

OS Bootcamp slide 6.2 - Exceptions.

Resposta correta: Database, Communication and Security Exceptions are automatically thrown by the platform.

Pergunta 19

Correta

Nota: 1,00 em 1,00

The After Fetch event:

Selecione uma opção:

- ☐ a. Happens after fetching new data through synchronization.
- ☒ b. Is triggered after an Aggregate finishes fetching data. ✓ It's correct!
- ☐ c. Only happens after a Data Action finishes fetching data.
- ☐ d. Always happens after a new screen is requested.

The After Fetch event is triggered right after an Aggregate or Data Action finishes fetching data. Since each Aggregate or Data Action can have its own On After Fetch event handler, you can implement logic to act upon the data retrieved from specific data sources.

Resposta correta: Is triggered after an Aggregate finishes fetching data.

Pergunta 20

Correta

Nota: 1,00 em 1,00

Which of the following is a possible reason for this error to be displayed to the user?

✖ The INSERT statement conflicted with the FOREIGN KEY constraint "OSFRK_OSUSR_FOO_TRAINEES_OSUSR_FOO_GENDER_GENDERID". The conflict occurred in database "FGFGS7013", table "dbo.OSUSR_FOO_GENDER", column 'ID'. The statement has been terminated.

Selecione uma opção:

- ☒ a. The Entity Trainee has a GenderId attribute, which is a Foreign Key to the Entity Gender. The GenderId attribute is also marked as mandatory on the database. And the End-User is trying to save a Trainee without selecting a valid Gender on the Form. ✓ It's correct!
- ☐ b. The Entity Trainee has a Unique Index with two of its attributes: Trainee Identifier and Gender Identifier. If an End-User tries to Save a duplicate Record of the Trainee with the same Gender, the error will be displayed.
- ☐ c. The End-User is trying to add an existing Trainee on the Gender List, without selecting the Trainee name and before the Save Button is clicked. Thus, the Trainee Identifier is sent to the Database as NULL.
- ☐ d. The Developer defined the GenderId as a Mandatory field on the Gender Dropdown widget, but the End-User forgot to selected one valid Gender when he saved the Trainee Record on the database.

The Mandatory Entity Property indicates whether the attribute is mandatory or optional.

However, this is only a piece of metadata information that doesn't guarantee if a Record with an empty mandatory attribute will be saved or not on the database. The big exception here happens if the mandatory attribute is a mandatory Foreign Key.

In that specific case, the database will look at the value that a user is providing to see if it exists in the related Entity. The problem is when the End-User is NOT providing this value, so the platform assumes 0. But the IDs in Entities by default start at 1, so the database doesn't find a match and raises the error.

Resposta correta: The Entity Trainee has a GenderId attribute, which is a Foreign Key to the Entity Gender. The GenderId attribute is also marked as mandatory on the database. And the End-User is trying to save a Trainee without selecting a valid Gender on the Form.

Pergunta 21

Correta

Nota: 1,00 em 1,00

Complete the sentence:

The _____ always happens before data from an Aggregate is rendered.

Selecione uma opção:

- ☐ a. Ready event.
- ☐ b. Initialize event.
- ☐ c. Render event.
- ☒ d. After Fetch event. ✓ It's correct!

After data is fetched, the After Fetch event occurs and, since the data returned from the Aggregate or Data Action belongs to the screen or block data and has changed, the Render event also occurs.

comment:

OS documentation at

https://success.outsystems.com/Documentation/11/Developing_an_Application/Implement_Application_Logic/Screen_and_Block_Lifecycle_Events#on-after-fetch

Resposta correta: After Fetch event.

Pergunta 22

Nota: 0,00 em 1,00

Consider an entity Project with an attribute Name. The attribute data type is Text, and the 'Is Mandatory' property is set to Yes. If you try to insert a record in this Entity, using the CreateProject Entity Action, without defining a value for this attribute, what happens?

Selecione uma opção:

- ☒ a. An exception raises, as the 'Is Mandatory' property set to Yes creates a constraint in the Database. ✗ The answer is not correct.
- ☐ b. You can insert records without specifying a value for that attribute but it will display a warning.
- ☐ c. The Database ignores the 'Is Mandatory' property as it is only metadata. The record receives the default value for the Name attribute.
- ☐ d. The Database ignores the 'Is Mandatory' property as it is only metadata. The record receives the NULL value for the Name attribute.

The Is Mandatory property in Entity attributes are not relevant for database operations. A Text attribute with the Is Mandatory set to True, for example, will not prevent the record of being saved if the user does not provide a value, as in OutSystems, it will always have a value (in this case, an empty string). This property is used to let Service Studio know which value to set on the Mandatory property of an Input Widget when it is automatically created in a form. In the form, the Mandatory of inputs is used for validation.

Resposta correta: The Database ignores the 'Is Mandatory' property as it is only metadata. The record receives the default value for the Name attribute.

Pergunta 23

Correta

Nota: 1,00 em 1,00

Using the Debugger, what is one of the possible solutions if you want to analyze an exception flow in your code when it raises on browser?

Selecione uma opção:

- ☐ a. Add a breakpoint directly on Screen Action responsible for executing the code that will raise that specific exception, before you start the Debugger. Then test your app on browser, once the code stops, go through your code flow inside Service Studio, until you reach the Exception flow.
- ☒ b. All options are valid. ✓ It's correct!
- ☐ c. Add a breakpoint on the Start Node of your Screen Action responsible for executing the code that will raise that specific exception, before you start the Debugger. Then test your app on browser, once your code stops working go to the Service Studio and inspect your code flow until reach the Exception flow.
- ☐ d. Add a breakpoint on the Raise Exception node present in your code flow, before you start the Debugger process. Then on browser execute the procedure that will raise that exception. After the code stops, inspect the Exception flow on Service Studio.

On document 5.3 - Debugging Apps, you can read what are breakpoints and where to add them when you want to inspect your code.

Resposta correta: All options are valid.

Pergunta 24

Correta

Nota: 1,00 em 1,00

Consider the entities Book and Publisher, where Book has a non-mandatory reference attribute to Publisher. What type of Join should you use between Book and Publisher in an Aggregate, if you want to return all Books with any (including none) associated information about their Publisher:

Selecione uma opção:

- ☐ a. Book Only With Publisher
- ☐ b. Book With Publisher
- ☒ c. Book With or Without Publisher ✓ It's correct!
- ☐ d. Publisher With or Without Book

When adding an Entity to an Aggregate where there is already an Entity set up, and both Entities have a relationship defined through a foreign key, the Service Studio will automatically determine the JOIN condition between them. The JOIN condition selected by the Service Studio is based on the Is Mandatory property of the Foreign Key. If the Foreign Key is mandatory, it will add an Only With (Inner Join) condition. If it is not, it will add a With or Without condition will be added.

Resposta correta: Book With or Without Publisher

Pergunta 25

Correta

Nota: 1,00 em 1,00

Having in consideration the entity Employee and Card, what is the data type of both attributes Id?

Selecione uma opção:

- ☐ a. The Employee's Id is a Card Identifier, while the Card's Id is a sequential Long Integer.
- ☒ b. By default, the Employee's Id represents a primary key of type Long Integer, while the Card's Id represents a foreign Key of type Employee Identifier. ✔ It's correct!
- ☐ c. Both attributes are of type Long Integer, but the Card's Id must be defined manually, when a new record is created into the database.
- ☐ d. By default, the Employee's Id represents a reference attribute of type Integer, while the Card's Id represents a foreign Key of Employee Identifier data type.

The Id of the Employee is an Entity Identifier (primary key), by default the platform define this type of attribute as a Long Integer, auto number and always Mandatory. While the Card's Id is a Reference attribute (foreign key), so it will be the type of Entity Identifier. If you look at the diagram, it is easy to check that the Employee is connected with the Card entity, so the Card's Id is an Employee Identifier.

comments: Source on OS Documentation at:

Resposta correta: By default, the Employee's Id represents a primary key of type Long Integer, while the Card's Id represents a foreign Key of type Employee Identifier.

Nota: 1,00 em 1,00

Consider the Aggregate definition shown in the following image. What attributes will be part of the Output List of the Aggregate?

The screenshot shows an 'Aggregate' configuration interface. On the left, under 'SOURCES', there are three entities: 'Album', 'Song', and 'Track', each with a trash icon and an eye icon. Below them is a '+ Add Source' button. On the right, under 'JOINS', there are two join conditions: 1. 'Album' joined 'Only With' 'Track' with the condition 'Album.Id = Track.AlbumId'. 2. 'Track' joined 'Only With' 'Song' with the condition 'Track.SongId = Song.Id'. Below the joins is a '+ Add Join' button. At the bottom, there is a list of attributes for the output. The first three attributes are highlighted in blue: 'Group of Album' (Album), 'Group of Artist' (Artist), and 'Count of Id' (NumberOfTracks). The remaining attributes are 'Album' (Name), 'Album' (AlbumArtist), 'Album' (Genre), 'Song' (Name), and 'Song' (SongArtist). A '+ New attribute' button is on the far right.

Group of Album	Group of Artist	Count of Id	Album	Album	Album	Song	Song
Album	Artist	NumberOfTracks	Name	AlbumArtist	Genre	Name	SongArtist

Selecione uma opção:

- ☐ a. Only the eight Attributes visible in the image.
- ☐ b. All the attributes from all the Aggregate Source Entities.
- ☒ c. Only Album, Artist, and NumberOfTracks. ✔ It's correct!
- ☐ d. Name, AlbumArtist and Genre from the Entity Album, and Name and SongArtist from the Entity Song.

Aggregates follow the same rules as SQL, as it is a way to configure a database SELECT query. In a SELECT statement, the attributes available in the result, the ones you can add to the SELECT clause, depends if you are using the GROUP BY or Aggregate functions (count, max, etc.), or not. In Aggregates, the same will happen. But there is a visual hint about which attributes are available in the output: Only the blue attributes are available at the output of an Aggregate.

Resposta correta: Only Album, Artist, and NumberOfTracks.

Pergunta 28

Nota: 1,00 em 1,00

Considering that a Movies List has an aggregate as its source, and the Cinemas List is bound to a Data Action instead, which of these lists will the Screen display to the End-User first?

The screenshot shows a user interface with two main sections: 'Movies' and 'Cinemas'. The 'Movies' section displays two items: '9/11: Explosive Evidence: Experts Speak Out' and 'A Florida Melancholy'. The 'Cinemas' section displays five items: 'AMC Loews 34th Street 14', 'UA Court Street Stadium 12 & RPX', 'Prince Charles Cinema', 'Odeon Cinema - The Lounge', and 'Louis Hartlooper Complex'. To the right of these sections is a 'Lists' panel with a dropdown menu showing 'GetMovies' and 'GetCinemas'.

Selecione uma opção:

- ☒ a. By default, aggregates and data actions are both requested at the same time. However, it's not possible to know which of the queries will be returned first. ✔ It's correct!
- ☐ b. Aggregates are always fetched and returned first.
- ☐ c. The one defined with 'Fetch Data on Demand' will be the first to have the List rendered on the screen.
- ☐ d. Data Actions are fetched and returned before Aggregates.

Aggregates and Data Actions start executing when the Screen is initializing, and the process is done asynchronously and in parallel, so it is not possible to know what query will be available first.

By default, all queries are created with the fetched property set to 'At start', but Aggregates or Data Actions with Fetch property set to 'Only on demand' do not run when the screen is initializing and needs to be triggered programmatically.

comment:

OS bootcamp slides: 9.2 - Fetching Data On Demand.

Resposta correta: By default, aggregates and data actions are both requested at the same time. However, it's not possible to know which of the queries will be returned first.

Pergunta 29

Incorreta

Nota: 0,00 em 1,00

What can be inserted in the SourceDataPointList property of a Chart widget?

Selecione uma opção:

- ☐ a. A List of any type, but if it's not of type DataPoint List then, the mapping must be done in the property box of the Chart widget.
- ☐ b. Any List can be there, but if it comes from a Data action, the mapping must be done.
- ☒ c. Only a List that is the output of an Aggregate or a Data action. ❌ The answer is not correct.
- ☐ d. Any List can be there, and the mapping must always be done.

The SourceDataPointList is a mandatory property of the charts and need to be of DataPoint List type. However, if the source list is not a DataPoint List, you can map the data points through manual definition of the Label and Value properties of the chart data points with the List Attributes. In the end the list of all data points will be plotted on the chart.

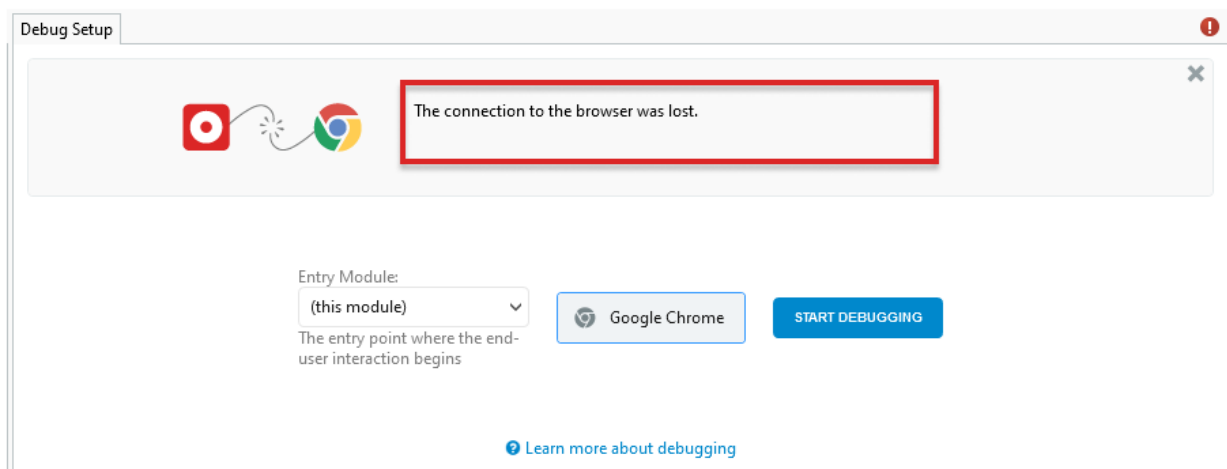

Resposta correta: A List of any type, but if it's not of type DataPoint List then, the mapping must be done in the property box of the Chart widget.

Nota: 0,00 em 1,00

If there is an **AreaChart** on a screen, when will the **OnClick event** be triggered?

Selecione uma opção:

- ☐ a. When the end-user clicks on the chart, but in the widget's AdvancedFormat property, the UserInteraction attribute must be set to True.
- ☐ b. When the end-user clicks on the chart.
- ☐ c. When the end-user clicks on the chart, but the Clickable property of this widget must be set to True.
- ☒ d. When the end-user clicks on the chart, but it requires an event handler. ✗ The answer is not correct.

The AreaChart has the Clickable property. This property is optional to be field and of type Boolean. If you set the property value to True, it will allow the user to click on plotted values to execute an On Click action.

Resposta correta: When the end-user clicks on the chart, but the Clickable property of this widget must be set to True.

Pergunta 32

Incorreta

Nota: 0,00 em 1,00

Regarding Event Handlers of Block's Instance Events, select the correct option.

Selecione uma opção:

- ☐ a. You can set, as an Event Handler, both screen actions as well as general Client Actions not bound to a Screen.
- ☐ b. All other options are correct.
- ☐ c. If an Event is not Mandatory, it is not necessary to define an Event Handler for this Event on a Block's Instance.
- ☒ d. An Event Handler may or may not be mandatory, but its Input Parameters are always mandatory if a Handler is set ✖ The answer is not correct.

Check '7.2 - Block Events' document. Both Events and Events' Input Parameters can have the Is Mandatory property configured to Yes or No, and Service Studio will respect the configuration for both. Regarding Event Handlers, due to scope, only screen actions can be bound to a Block Instance Event.

Resposta correta: If an Event is not Mandatory, it is not necessary to define an Event Handler for this Event on a Block's Instance.

Pergunta 33

Correta

Nota: 1,00 em 1,00

When, in an Aggregate, you hide some of its columns, what happens?

Selecione uma opção:

- ☐ a. The columns will be protected, so they will not be saved on the browser cache.
- ☐ b. The other Team Developers stop having access to that attributes.
- ☒ c. Nothing happens at runtime. ✔ It's correct!
- ☐ d. The hidden attributes will be discarded from the output result of the Query.

The hide columns on Aggregates are usefully just for previewing purposes by Developers. It does not affect the Aggregate's output. The attributes used outside the Aggregate it will determine which columns are fetched or not.

comments:

Source from Reactive bootcamp: 4.3 - Advanced Aggregates

Resposta correta: Nothing happens at runtime.

Pergunta 34

Incorreta

Nota: 0,00 em 1,00

Given the following Aggregate, how would you modify it to return, for each product, the highest quantity purchased in any single order, and the average price of the product?

 **GetOrderItems**  Sources  **Filters**  Sorting  Test Values

FILTERS
 Add Filter

1

 OrderItem OrderId	 OrderItem ProductId	 OrderItem Price	 OrderItem Quantity	 Price * Quantity TotalPrice	 New Attribute
1	2	120	2	240	
1	1	25	20	500	
1	3	230	4	920	
2	2	120	3	360	
2	4	12	5	60	

Selecione uma opção:

- ☐ a. Add a new computed attribute called AveragePrice, with its Formula set to Avg(Price, GroupBy: ProductId), and sort the results by Quantity.
- ☐ b. Create a new Filter with Max(Quantity) = OrderItem.Quantity, and then group by ProductId and apply the Avg function to Price.
- ☐ c. Group the results by ProductId, and then apply the Max function to Quantity and the Avg function to Price.
- ☒ d. Group the results by OrderId, apply the Max function to Quantity, and the Avg function to Price. ❌ The answer is not correct.

The correct sequence of setting up an aggregate it's important. In case that you sum (aggregate function) all records of an aggregate, before you group the information by a specific criterion, the aggregate will return to you only one row with the result of your aggregate function, instead of one row for each line of your criterion. E.g. this is the difference between you count all users that you have your database, as a result, you will have only 1 row with the total, that now you can not split in genders, because you grouped all data no matter the gender. But if you first group the information by genders and then count the number of users that correspond for each gender, you will have a row for each gender with the total of users inside of it. (check the 4.3 - Advanced Aggregates to more details).

Resposta correta: Group the results by ProductId, and then apply the Max function to Quantity and the Avg function to Price.

When does a Site Property reset to its default value?

Selecione uma opção:

- ☐ a. Whenever the User signs out of the application.
- ☐ b. Whenever the User signs in the application.
- ☒ c. It is a global variable that never resets. ✓ It's correct!
- ☐ d. Immediately, when the Login Session times out.

A Site property is a global variable that has a constant value, or a value that does not change often and never resets.

Comments:

Resposta correta: It is a global variable that never resets.

Pergunta 36

Incorreta

Nota: 0,00 em 1,00

Regarding Server Actions, select the correct answer:

Selecione uma opção:

- ☐ a. All options are wrong.
- ☐ b. Can execute Client Actions.
- ☒ c. Can end its flow with a Destination node. ✗ The answer is not correct.
- ☐ d. Can not be recursive.

Server actions are executed server-side. They can call other server actions but they can not call client actions since they are not executed client-side. A server action can call itself, allowing recursion. A Server action does not have access to the scope of the screen or to the navigation flow, so they can not use Destination nodes to navigate, nor use the download node and other screen specific elements.

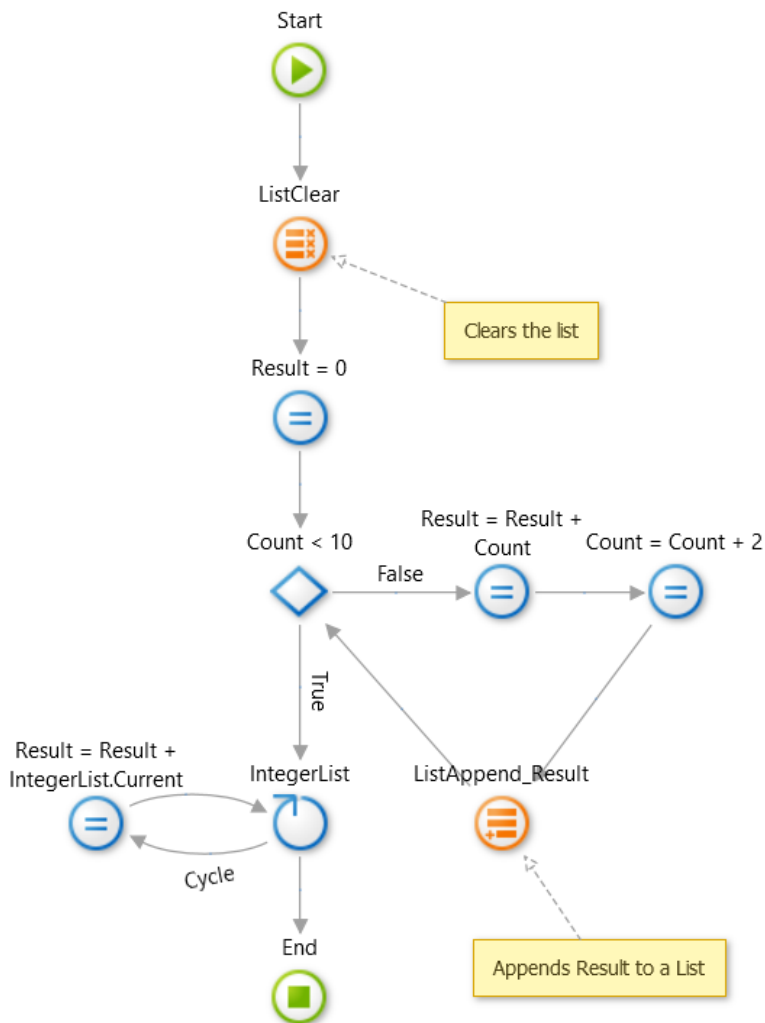

Resposta correta: All options are wrong.

Pergunta 37

Correta

Nota: 1,00 em 1,00

Based on the image below, if Count starts in 5, what will be the value returned by the action through the Result Output Parameter?

Selecione uma opção:

- ☐ a. The application will timeout due to an infinite looping.
- ☐ b. 21
- ☒ c. 0 (zero) ✓ It's correct!
- ☐ d. 59

At the beginning of the action flow, the list is cleared and Result is set to zero. As the count variable starts in 5, the IF condition is true, and execution follows the true connector. As the list is empty, the ForEach will not execute any iteration, and the action terminates without changing the Result variable that ends with the value 0 (zero).

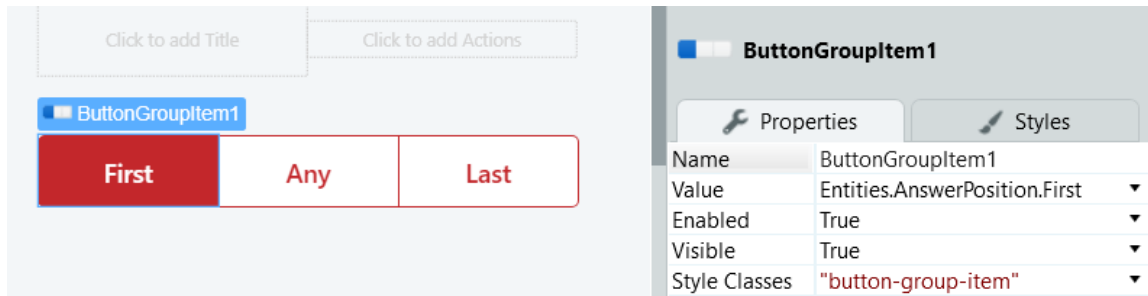

Resposta correta: 0 (zero)

Pergunta 38

Incorreta

Nota: 0,00 em 1,00

Based on the image below, what should be the Data Type of the variable associated with the ButtonGroup Widget?

Selecione uma opção:

- ☐ a. The variable should be of data type Text as client-side the values are always text.
- ☐ b. The variable must be of the same data type of the ButtonGroupItem values: AnswerPosition Identifier.
- ☐ c. The variable can be of any data type. The platform will convert the option value to the variable data type.
- ☒ d. The variable must have a Long Integer data type as the default data type of the Id Attribute of a Static Entity is always Long Integer. ✗ The answer is not correct.

Remember, the value you can store in a variable must be compatible with the data type of the variable.

An individual button (ButtonGroupItem) represents an option of a ButtonGroup widget. So, the ButtonGroup will have a variable associated, to store the option selected by the user, when this clicks on one of the ButtonGroupItems.

On a side note, You can use the ButtonGroup to display buttons choices to the user. This pattern is ideal when you have two to four options. To show a larger number of options, consider using the Dropdown UI Pattern.

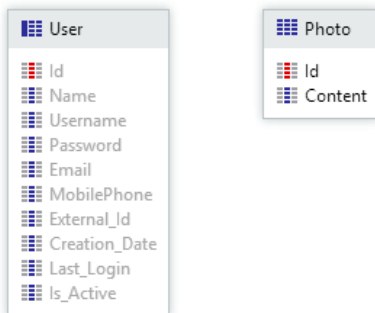

Resposta correta: The variable must be of the same data type of the ButtonGroupItem values: AnswerPosition Identifier.

Pergunta 39

Incorreta

Nota: 0,00 em 1,00

Given the system's User entity and a Photo entity, as depicted in the image below, what is the best way to model that a User may have a unique profile photo?

Selecione uma opção:

- ☒ a. Add to the User Entity a Photold attribute, of type Photo Identifier. ✗ The answer is not correct.
- ☐ b. Create a Profile Entity with attributes Photold and UserId, of types Photo Identifier and User Identifier respectively.
- ☐ c. Add to the Photo Entity a UserId attribute, of type User Identifier.
- ☐ d. Change the Photo Entity's Id attribute to be of type User Identifier.

When we want to guarantee that a record in an entity has a relationship with only one other record in another entity, we can change the second entity identifier to be an identifier to the first entity. It will be, at the same time, a primary key to its entity, and a foreign key to the other entity. This way, we guarantee a one-to-one relationship. For example, if you want to ensure that a Author has only one Biography in the Biography entity, you can change the Biography Entity's Id attribute to be of type Author Identifier. The Biography Entity will become an "extension" of the Author entity.

Resposta correta: Change the Photo Entity's Id attribute to be of type User Identifier.

Pergunta 40

Correta

Nota: 1,00 em 1,00

When is the Render Event triggered?

Selecione uma opção:

- ☐ a. Once, after all the structure of the screen is complete.
- ☐ b. Every time an aggregate's data is ready to be used.
- ☐ c. Once, after all the data is on the screen.
- ☒ d. Every time there's a change in an aggregate that affects the screen. ✓ It's correct!

Every time there is a change in data being used on the screen, the screen will be updated, and so, the Render event will be triggered. You can see more about the screen lifecycle in the presentation "9.2 - Fetching data on-demand" from the slide deck.

Resposta correta: Every time there's a change in an aggregate that affects the screen.

Pergunta 41

Correta

Nota: 1,00 em 1,00

Consider that Kelly is a user with the Manager role. What will be the Server response when she navigates to the **SecurityUsers** screen via the browser.

SecurityUsers Screen	
Name	SecurityUsers
Description	...
Title	
Public	No
Roles	
Anonymous	<input type="checkbox"/>
Registered	<input type="checkbox"/>
Admin	<input checked="" type="checkbox"/>
Manager	<input type="checkbox"/>
Events	
Event	
Advanced	
Style Sheet	...
Required Scripts	

Selecione uma opção:

- ☐ a. The Server will raise a Communication Exception because it is expecting the Kelly Admin roles credentials to return the page.
- ☒ b. The Server will raise a Security Exception because Kelly doesn't have enough permissions. ✓ It's correct!
- ☐ c. The Screen will be sent by the server, and the page will be rendered on the browser.
- ☐ d. The Server will raise a Database Exception because it can not find the Admin role associated with Kelly.

Security Exceptions can be raised by OutSystems whenever you have authentication or other security mechanisms in your application module, like roles checked or unchecked on a Screen.

Security Exceptions include:

- Invalid Login: The login provided by the end-user is not correct. This exception is raised by the Login and LoginPassword System actions.
- Not Registered: The end-user is not registered and cannot access the current screen without registration. When you create new custom Roles in your module, OutSystems creates specific Role Exceptions under Not Registered Exception:
 - Not – the end-user is accessing a screen without an authorized Role.

Comment:

source on OS Documentation at:

https://success.outsystems.com/Documentation/11/Developing_an_Application/Implement_Application_Logic/Handle_Exceptions#Abort_Activity_Chang

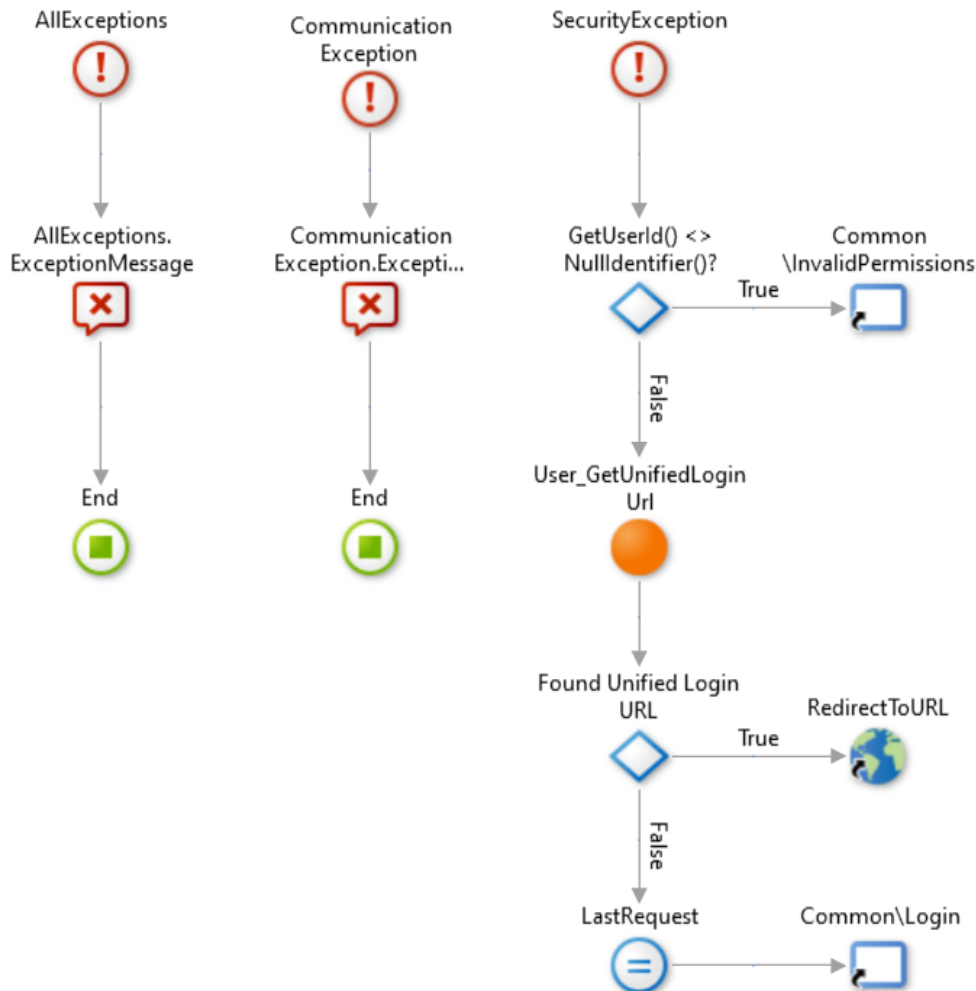

Resposta correta: The Server will raise a Security Exception because Kelly doesn't have enough permissions.

Pergunta 42

Correta

Nota: 1,00 em 1,00

An End-User logged in to your Reactive application is trying to access a Screen, but the user doesn't have the required role permissions checked on that Screen. What will happen in this situation, taking into consideration the OnException flow image below?

Selecione uma opção:

- ☐ a. First, the user will see a generic Exception Message (from AllExceptions). Then, the user needs to click on the button to try the communications between the app and the server, and only if the communication test runs with success, the Security Exception will be performed.
- ☐ b. The application will close, and the user account will be blocked.
- ☐ c. The user will be redirected to the Users Applications here she/he can assign the role to her/his account.
- ☒ d. If the user's Session didn't timeout, the user will be redirected to another screen. ✓ It's correct!

The exceptions raised in your module are handled in a flow starting with an Exception Handler element. In an action, you can have more than one Exception Handler flow, in order to handle different types of exceptions.

An exception can be raised by OutSystems or in your logic at any point of your module. For typical UI requests, you can handle the raised exceptions by:

- Adding an Exception Handler element and its logic in your action's flow.
- Or let the On Exception of your module do the work.

The platform checks what is the most specific Exception to call its handler, instead of executing each one of the possible Exceptions that exists in your module.

Resposta correta: If the user's Session didn't timeout, the user will be redirected to another screen.

Pergunta 43

Correta

Nota: 1,00 em 1,00

How can you create two Entities through one Excel file?

Selecione uma opção:

- ☒ a. You can use Bootstrap to create both Entities at the same time, using the name of each Entity as the name of each sheet with their respective attributes. ✔ It's correct!
- ☐ b. It is not possible to use Excel files to import entities. It's only possible to create Entities manually in Service Studio or consume External Databases.
- ☐ c. You can do that adding the Upload tool to a page of your app, then on the browser, you can import the Entities through the Upload tool wizard.
- ☐ d. To use Bootstrap it's necessary to use different files, one for each Entity, where each file name corresponds to one OutSystems Entity name.

You can import data from an Excel file to load data to an entity. This is useful when you are developing and testing your application. This way, you can quickly have your data up and running in the application while developing it. Each Excel sheet has the name of one Entity, and the column headers of each sheet have the names of the Entity Attributes.

Resposta correta: You can use Bootstrap to create both Entities at the same time, using the name of each Entity as the name of each sheet with their respective attributes.

Pergunta 44

Correta

Nota: 1,00 em 1,00

Regarding Events, select the correct answer:

Selecione uma opção:

- ☐ a. Events can be triggered from Server Actions.
- ☐ b. On a Block Instance, an Event must always have its Handler configured.
- ☒ c. Events can be triggered from Screen Client Actions. ✔ It's correct!
- ☐ d. On a Block Instance, you can configure, as an Event Handler, any Client Action.

Block Events are client-side events. There are two ways to trigger an event, both of them from inside the block where the event is defined: You can trigger the event from a Client (screen) action, or you can trigger it directly from a button or a link in the block. Also, events and event inputs have the property Is Mandatory, meaning that both can be set to be optional. When they are optional, there is no need to have a handler or a handler input configured. Check the presentations "9.1 - Screen Events" and "3.1 - Reactive UI Development" from the slide deck.

Resposta correta: Events can be triggered from Screen Client Actions.

Consider the following form where the Save button is bound to the Save action shown on the image. Knowing that the Save button does **not have** Built-in Validation, what happens when the end-user presses the Save button? Please consider that ISBN is of input type Text, bounded to an entity attribute of data type Text.

New Book

ISBN *

Title

The Necronomicon

Author

Abdul Alhazred

Back

Save

MainFlow ▶ BookDetail ▶ **SaveDetail**

Start

BookCreateOrUpdate

MainFlow\BookList

Selecione uma opção:

- ☒ a. The book is not created and the user will be redirected to an internal error Screen. ❌ The answer is not correct.
- ☐ b. The book is created with an automatically generated ISBN, different from empty text, and the user is redirected to the BookList screen.
- ☐ c. The book is created and the user is redirected to the BookList screen, but the ISBN value stored in the record will be an empty text.
- ☐ d. The book is not created and the ISBN field will have a validation message indicating that it is a required field.

As the built-in validations are not enabled, no verification regarding empty mandatory fields or invalid datatypes will be performed. So, the fact of a mandatory input being empty doesn't set this input's valid property to FALSE. If an action bound to the Save button that does not have Custom Validations and does not validate if the Form is valid as well the form it would be valid anyway and the record will be saved on the database, because to the database, the Is Mandatory property of an Entity Attribute is not relevant. So in a case of an empty text attribute, even it is a mandatory one, the platform will send an empty string as the value of that field, because this is the default value for a text data type, and the record will be created successfully.

Resposta correta: The book is created and the user is redirected to the BookList screen, but the ISBN value stored in the record will be an empty text.
